

# MMA & PA INSIGHT STUDY

## Help Generate New Insights

Join our study to help us learn more about MMA and PA

Online participation is easy

**The MMA and PA Insight Study** will evaluate how to best assess thinking and behavior in children and adults with methylmalonic acidemia (MMA) and propionic acidemia (PA).

Several tests will be evaluated for how well they can measure verbal communication, processing speed, life skills, quality of life and sleep.

## Join our Study from Home

We are now recruiting at least 25 subjects with MMA or PA to join this study. No visits to a clinic are required. Participants will take a few tests online and have a video call with a study investigator.

Parents/caregivers of children or adults who are unable to participate will be asked to complete the questionnaires. The participants will be 3 years of age or older, with or without having an organ transplant.
